
Width 12 Hz chosen from the tea→toast sweep (narrowest interior width whose effect there clears the seed-to-seed noise floor; see fig_bandsweep_width_selection_tea_to_toast). Applied unchanged to both directions here, so this is a direct check of whether that width still shows an effect on the OTHER direction, not just the one it was chosen from. Dashed lines are each direction's own baseline (no band removed) — the two directions do not start from the same accuracy, so read the drop against its own baseline, not against the other line. Shaded band = range across the 5 seeds.
