Multi-width band-stop sweep — pooled_tasksplit_chanz_matched, full_ft, toast→tea

469 bands, widths 5–18 Hz across 1–45 Hz, 5 seeds, 3058 windows / 27 patients. Baseline BA 0.710 (seed spread 0.023).
Width is not comparable across rows of A — a wider notch removes more signal by construction; that is what panels C and D exist to remove. 469 bands were tested, so the argmax is a maximum over 469 draws: read the profile, not the peak.
Frequency axes are a post-hoc lens — the model never saw a band definition. 0.832 here vs 0.435 leak-free (recid 0.920): Tier E candidates, not biomarkers.
